ABSTRACT:

A system and a method of publishing an product document for clients for the purpose of publicly disclosing an invention to end users on the Global Information Network. The system includes a first Web site system having a publicly accessible database for storing a plurality of product documents received from clients. The Web site also includes a search engine accessible to the end user. The search engine is in electronic communication with the database and can receive a search request the end user, allowing the end user access to one or more of the product documents. The product document preferably includes a primary text file and attachment files which may include drawing files. The product documents may be digitally notarized and time/date stamped.

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] The instant application is a continuation-in-part of U.S. Ser. No. 09/661,009 filed Sep. 13, 2000.

DOCUMENT-IDENTIFIER: US 6557054 B2

TITLE: Method and system for distributing updates by presenting directory of software available for user installation that is not already installed on user station

Detailed Description Text (197):
In another application of this Level 2 embodiment depicted in FIG. 11, transporter 14 includes multiple client-server protocols enabling it to access any one of several online servers I, J and K. This embodiment enables a publisher to distribute product and permit the user to update or supplement it via whichever online service they happen to use, or subscribe to, thereby enabling a publisher to economize on the server function by using an established online service, yet reach the widest possible electronic consumer base by reaching users through any one of multiple services, e.g. CompuServe, America Online, Prodigy, Microsoft Network or other proprietary online service, or Internet access provider, each of which may have limited accessibility determined by market scope, geography or technology or the Tike.

Detailed Description Text (242):

Of course, as described above, the offline browser system can be distributed as a shell which uses the transporter to fetch completing elements and content from a remote site, via a telephone network or equivalent network. By disconnecting, automatically if so desired, when the specified information object transport operation or operations has or have been completed the transporter of the invention limits line or access charges. In contrast, with conventional online Web browsing time charges continue to accumulate while the user views or processes received material. The transporter can be repeatedly reactivated on an as-needed basis to provide intermittent communication with the remote server or servers specified or user-entered in its setup protocols, thereby simulating the ongoing, open-ended interactivity of an online connection with the remote server. Naturally, the Web site sponsor may choose to modify the local pages as compared with their Web site counterparts, for example to simplify them, or to provide access to content or function intended by the sponsor for local use only.
